

Toner MMWM-47 Chassis

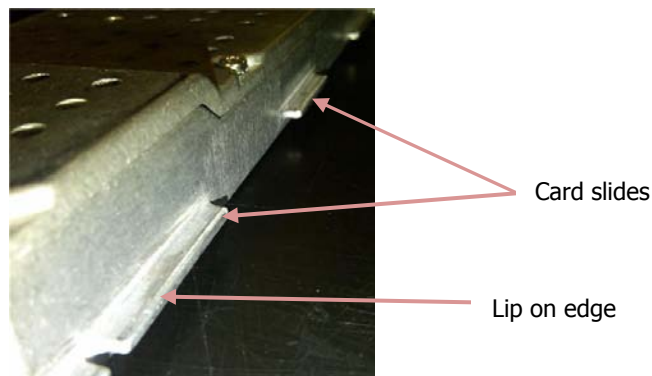

This chassis is for the mounting of a single Minimod type of modular headend component. This chassis will accept all of the following current manufacturers' single width units Toner, Blonder Tongue, RL Drake & Pico Macom. Other brands may or may not fit.

The chassis is labeled for the most common modulators and demodulators. The labeling will probably not be accurate for other devices such as stereo encoders or digital devices. These devices will still work in this chassis, you just have to identify the connections.

The chassis is designed so you can slide a module in from the front (opposite of the label) and the connections will be accessible at the rear. The chassis has a stainless steel spring that engages the module for a friction fit so the module will not fall out. The chassis can be mounted using the 4 holes provided in the bottom flanges.

The power supply is a universal 100-240VAC model and is sufficient to power any one of the current modules from the above manufacturers. As the unit is universal powered you just need the correct power cord for your country. We stock the standard US cord, the UK cord and the European cord. This is designed for indoor use only.

NOTE: Some of the Blonder Tongue modules that use a die-cast housing have a small lip along the edge of the card slide. This lip may be leftover flashing from the molding process. The lip may make it difficult to install the module in the MMWM-47 because it is tight in the plastic card slides. This can be easily and quickly corrected with a flat file. Just file the lip down with a few quick passes of the file.
